

# ADJUSTING PICTURE QUALITY

Streaming live 360 degree HD video on your smartphone requires adequate wireless network signal strength and bandwidth for optimal performance. We recommend a 1 megabyte per second **upload** speed from your home Wi-Fi network and 3 megabytes per second **download** speed to your smartphone (your Internet Service Provider may have an online “Speed Test” that can verify your Wi-Fi performance).

If you experience poor video quality or a “buffering” message in the **Monitor** area of your app, adjusting the picture quality level down (e.g. from High to Medium) will lower the bandwidth usage and enhance video performance. Try different quality levels until your video quality improves.

- 1 Press the **cog** icon below the monitor screen.

- 2 Adjust the picture quality by moving the slider to the desired setting. To test your setting observe the video image on your monitor and adjust accordingly.
