

POSITIONING YOUR CAMERA DURING SETUP

To achieve optimal performance it's important to properly position your camera during setup. Follow these positioning tips:

- 1 Place your Guardzilla 7-8 feet off the ground and angle it down approximately 15-20 degrees.

- 2 Position the camera so traffic passes side-by-side in front of the lens, not straight on.

- 3 We recommend against having your camera view through a window. Doing so won't effect the video image, but windows can reflect heat back to the camera, which can compromise motion detection and night vision performance.
- 4 Place your camera to avoid objects that move frequently such as a swinging branch or passing cars, which can cause frequent motion detection events and shorten your battery life.
- 5 Minimize both the distance from your WiFi router AND any obstructions. Try to avoid heavy obstructions like thick walls, fireplaces, metal, concrete and glass.
